PRESENTATION TOPICS

RenalTech™ is a new artificial intelligence model (developed as a collaboration among Mars, Waltham, Banfield and Antech Diagnostics) that predicts whether a cat will develop chronic renal disease up to two years prior to the onset of disease. This presentation will review the data used to create RenalTech and support its accuracy, how to interpret the RenalTech Status of a cat and outline follow up and personalized care pathways using clinical case examples.

CADET® BRAF and BRAF-PLUS is the first liquid urine biopsy using DNA-based testing for early detection, diagnosis and monitoring of transitional cell carcinoma/urothelial carcinoma.
